Macawa, N.; Nakagawa, M.; Kobayashi, K.; Yamano, S.; Izawa, Y.; Nakamura, K.; Harashim Bacteriol. 172, 6704-6712, 1990
Title: Blucidation of the Erwinia uredovora carotemoid biosynthetic pathway by function Reference number: A37802; MuID:91072214; PMID:2254247
Jacession: D37802
Status: preliminary
Molecule type: DNA
Residues: 1-492 <MIS>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

Application US/07783705A)
Patent No. 5429939
GENERAL INPORMATION
APPLICANT: Misawa, No. 5429939ihiko
APPLICANT: Mobayashi, Kazuo
APPLICANT: Nakamura, Katsumi
APPLICANT: Vamano, Shigeyuki
TITLE OF INVENTION: DNA SEQUENCES USEFUL FOR THE
TITLE OF INVENTION: SYNTHESIS OF CARCTENOIDS
INUMBER OF SEQUENCES: 18
CORRESPONDENCE ADDRESS:
ADDRESSER: Ladas & Parry

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                          2606

Patent No. 6677134

GENERAL INFORMATION:

APPLICANT: Pasamontes, Luis

APPLICANT: Taygankov, Yuri

TITLE OF INVENTION: Fermentative Carotenoid Production
FILE REFERENCE: 15464 US (C38435/125944)

CURRENT PILING DATE: 2001-08-02

PRIOR PILING DATE: 1997-12-01

PRIOR APPLICATION NUMBER: 08/980,832

PRIOR PILING DATE: 1997-12-01

WPI; 2002-351711/38. N-PSDB; AAD35512 Producing carotenoid compounds e.g. antheraxanthin and astaxanthin, by using microorganisms having a nucleic acid molecule encoding enzymes in the carotenoid biosynthetic pathway and which metabolize single carbon substrates.

Claim 19; Page 141-143; 156pp; English.

The invention relates to a method for producing carotenoid compounds. The method comprises a transformed metabolising host cell, comprising suitable levels of isopentenyl pyrophosphate and a nucleic acid molecule encoding an enzyme in the carotenoid blosynthetic pathway, under the control of regulatory sequences, and contacting the host cell with carbon substrate to produce a arotenoid compound. The method is useful for producing carotenoid compounds such as antheraxanthin and astaxanthin, by using microorganism having a nucleic acid molecule encoding enzymes in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9
                                                                                                                                                                                                                     The invention comprises the amino acid and coding sequence of a number carotenoid (crt)-related proteins. The crt-related DNA and protein sequences of the invention are useful for engineering cells which are able to produce carotenoids. The present amino acid sequence represents crt-related protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              241 NARVSHMETVGDKIQAVQLEDGRRFETCAVASNADVVHTYRDLLSQHPAAAKQAKGLQSK

The present invention describes Pantoea stewartii carotenoid biosynthetic enzymes (I). More specifically described are the geranylgeranyl pyrophosphate synthase (GrEB), zeazanthin glucosyl transferase (GrEX), lycopene cyclase (GrEY), phytoene desaturase (GrI), phytoene synthase (GrEB) and beta-carotene hydroxylase (GrEZ) enzymes (see ABP96685 to CAPP90 encoded by ACC44769 to ACC44764. (I) can be used for regulating carotenoid biosynthesis in an organism, by over-expressing (I) in an organism, such that the carotenoid biosynthesis is altered in the phytoene to the carotenoids (for creating recombinant organisms that have the ability to produce various carita compounds, and also for the carotenoids compounds, and also for the carotenoids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SLAPEGGGSYYVLAPVPHLGTANLDWAVEGPRLRDRIFDYLEQHYMPCLRSQLVTHRMFT 420

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel method for the preparation of carotenoids using genes and proteins isolated from Candida utilis. The invention specifically describes the isolation of a 3-hydroxy-3-methylightary1 coenzyme A (HMG-COA) reductase protein. This sequence represents the Candida utilis crtl protein which is used in the method the invention. (Updated on 17-0CT-2003 to standardise OS field)

                                                                                                       The present invention describes beta-carotin hydroxylase. Beta-carotene can be used in the preparation of xanthophylls and their metabolites. The present sequence represents an Brwinia uredovora crtl protein sequence from the present invention.                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is the Phytoene desaturase (PDS) enzyme, isolated from Erwinia uredovora, that can inhibit 4-hydroxy-phenylpyruvate pidoxygenese (4HPPD) in vitro. This peptide sequence is used in the production of plants having resistance or tolerance to herbicides of the isoxazoles family. The plasmid pyPIET4 is constructed using plant operable promoters like CaMV 355 and chloroplast transit peptide resulting in a transgenic tp-crt1 gene. This plasmid is transformed and over-expressed in tomato and tobacco plants. This sequence is specifically used to transform plants like banana, cotton, maize, tomato or vines. It is also applied to plants that allow selective weed control in fields. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9

The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primars for detecting the genome of P. luminescens and related species, to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polypeptides encoded by the genes are used for detection/identification of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that companies or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. compinest production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The carpentically vectors containing the genes are useful for theratemic vectors containing the genes and Ab are also useful chere are sensitive to P. luminescens-encoded toxins or antibiotics) and as are sensitive to P. luminescens-encoded toxins or antibiotics and as bioperticides. Other uses of the genes and the proteins are as virulence factors and for identifying targets of human diseases for which P. ceptons of the isolated P. luminescens proteins

```
The present sequence is that of the Erwinia herbicola phytoene dehydrogenase-4H which produces lycopene biosynthetically from phytoene through four sequential dehydrogenations controls. Other enzymes involved in the carctenoid biosynthesis pathway include geranylgeranyl prophosphate (AAW01118), phytoene synthase (W01121) and lycopene cyclase gene (AAM01125), whinjulation of, in partic., lycopene cyclase gene (AAM01125), by in frame linkage to the chloroplast transit peptide (AAW01124) of the tobacco ribulose bis-phosphate carboxylase-oxygenase gene can lead to increased production of total carotenoids in the chloroplast of transformed plants as compared to native, non-transformed plants of the same type. Beta-carotene is an effective and apparently harmless food colourant and is also in the pathway for biological cycle surface (Updated on 25-MAR-2003 to correct PF field.) (Updated on 16 corr-2003 to standardise OS field)
